

## Heating

Reptiles and amphibians are ectotherm, or so called “cold-blooded”. This means they have to regulate their body-temperature using heat from an external source, rather than generating their own body temperature like warm-blooded animals do. Reptiles need to thermo-regulate their body temperature by assimilating direct radiant heat from the sun while basking, or by soaking up conductive heat from surfaces such as rocks or forest floor heated by the sun.

# CERAMIC HEATER

## Ceramic Heat Emitter

- Innovative design, 99% heat efficiency
- Emits natural “sun-like” infrared heat
- No light emitted, does not disturb normal photo periods (day/night)
- Solid ceramic element, suitable for humid environments

The Exo Terra Ceramic Heater is a radiant heat source which creates a natural sun-like heat with a uniform pattern. The long wave infrared heat produced by this emitter will warm reptiles very efficiently. It also increases the ambient air-temperature in the terrarium. Infrared heat penetrates the scales and skin tissue, promoting health and healing as it widens the blood vessels and increases blood circulation.

The Ceramic Heater is to be used only with the specially designed Exo Terra Wire Light.

PT2044	Ceramic Heater	40W
PT2045	Ceramic Heater	60W
PT2046	Ceramic Heater	100W
PT2047	Ceramic Heater	150W
PT2048	Ceramic Heater	250W
